

What is claimed is:

1. A cable wiring construction for a cable provided between a controller operated by a seater on a seat and a unit body,
wherein a locking portion for locking an intermediate portion of said cable is provided on a seat back of said seat, and a height position of said cable in said locking portion is set so as to be higher than a seat cushion of said seat.
2. The cable wiring construction according to claim 1,
wherein a string-form locking member is provided between said seat back and a backboard fixed to said seat back with a plurality of clips, and
said locking member is provided with at least a pair of locked portions that are locked by clips at different places; and said locking portion which is positioned by being held by said seat back and said backboard and exits in an elongated form on an outer periphery of said backboard is provided between both said locked portions.
